

Standard Diagnostic & Imaging Tests (Indian Clinic MVP)

While pathology (blood/urine) tests are handled by the laboratory, clinics also perform various imaging and on-the-spot diagnostic tests. This data can be used to seed the `laboratory_tests` or a separate `diagnostic_services` table.

1. Radiology & Imaging

Test Name	Abbreviation	Description
Digital X-Ray (Chest)	CXR	Basic imaging of the lungs and heart to check for infections or structural issues.
Digital X-Ray (Bone/Joint)	X-Ray	Imaging for fractures, arthritis, or bone abnormalities.
Ultrasound Sonography (Whole Abdomen)	USG Abdomen	Imaging of liver, kidneys, gallbladder, and other abdominal organs.
Ultrasound Sonography (Pelvis)	USG Pelvis	Commonly used for gynecological or urological assessments.

2. Cardiology & Neurology

Test Name	Abbreviation	Description
Electrocardiogram	ECG / EKG	Measures the electrical activity of the heart to detect arrhythmias or ischemia.
Echocardiogram	2D Echo	Ultrasound of the heart to evaluate pumping function and valve health.
Treadmill Test (Stress Test)	TMT	Assesses heart performance under physical stress.
Electroencephalogram	EEG	Measures electrical activity in the brain (usually in larger polyclinics).

3. Pulmonology & Respiratory

Test Name	Abbreviation	Description
Pulmonary Function Test	PFT / Spirometry	Measures lung capacity and airflow; used to diagnose asthma or COPD.

Pulse Oximetry

SpO2

Quick, non-invasive measurement of blood oxygen saturation (often logged in Vitals).

4. Point-of-Care & Rapid Tests (Clinic Floor)

These are often done immediately by the nurse or doctor during the consultation.

Test Name	Abbreviation	Description
Urine Pregnancy Test	UPT	Rapid strip test for detecting pregnancy.
Capillary Blood Glucose	CBG / Glucometer	Instant blood sugar check using a finger prick.
Rapid Strep Test	RST	Quick swab test to detect streptococcal pharyngitis (Strep throat).
Rapid Influenza Diagnostic Test	RIDT	Quick nasal swab to detect flu viruses.

Implementation Note for Antigravity: If your architecture treats all billable medical tests the same, you can append these directly to the `laboratory_tests` table. If you want to separate them logically, create a new SQLAlchemy model called `diagnostic_services` and seed it using this file.
